

Contents

Introduction	1
Chapter 1. Spin systems	3
1.1. Spin matrices	3
1.2. Rotation of spins and symmetries	5
1.3. Spin systems	6
1.4. Hamiltonians and their symmetries	8
1.5. Gibbs states and correlation functions	9
1.6. Phase diagrams of ferromagnetic models	10
1.7. Exercises	12
Chapter 2. Fermionic and bosonic systems	15
2.1. Fock spaces	15
2.2. Creation and annihilation operators	18
2.3. The Bose-Hubbard model	21
2.4. Bose-Einstein condensation	22
2.5. The Hubbard model	26
2.6. Spin operators and symmetries	28
2.7. Relation to the antiferromagnetic Heisenberg model	29
Chapter 3. Equilibrium States	33
3.1. States for finite systems	33
3.2. Gibbs states in Hilbert spaces	35
3.3. Infinite volume Gibbs states	37
3.4. Extremal Gibbs states	48
3.5. Decomposition of states	51
3.6. Exercises	52
Chapter 4. Uniqueness and non-uniqueness of Gibbs states	55
4.1. Uniqueness of KMS states at high temperature	55
4.2. Long-range order in the XXZ-model	58
4.3. Long-range order using infrared bounds	64
Chapter 5. Mean-field systems	67
5.1. Permutation-invariant states	67
5.2. The mean-field equation	70
5.3. Gibbs states of some mean-field models	72
5.4. Exercises	74

Chapter 6. 2D systems with continuous symmetry	75
Appendix A. Mathematical supplement	81
A.1. Matrices and matrix norms	81
A.2. Hölder inequality for matrices	81
A.3. Trotter and Duhamel	83
A.4. Further matrix inequalities	85
A.5. A discrete Poincare inequality	86
A.6. About convex functions	88
A.7. Infinite-volume limits	89
A.8. Proof of the quantum Pinsker inequality	90
Appendix B. Solutions to some exercises	95
B.1. Spin systems	95
B.2. Fermionic and bosonic systems	98
B.3. Equilibrium states	100
B.4. Uniqueness and non-uniqueness of Gibbs states	105
B.5. Mean-field systems	105
B.6. Exercises in the appendix	106
Appendix. Bibliography	107
Appendix. Index	109
